

Four directional wheel system

Figure 1 represents a part of a mechanical system used for imposing a simultaneous orientation of the front and rear wheels of a vehicle (Honda system).
 The mechanism is planar (*within the plane* $(O_0, \vec{x}_0, \vec{z}_0)$), it is formed of 5 solids, namely:

- solid 0: reference, inner ring of centre O_0 and radius $2R$, the dimensions are such that $O_0 \vec{D} = -H \vec{x}_0 + L \vec{z}_0$
- solid 1: crank of length $O_0 A = R$,
- solid 2: satellite (disc) of centre A and radius R , a pin B is located at a distance $R/2$ from A ,
- solid 3 is a bar,
- solid 4 is formed of the female part of the prismatic joint between 4 and 3 plus a bar (*output of the mechanism*).

Parameters:

- 1/0: revolute joint of axis $(O_0, \vec{y}_{0,1})$, parameter ψ_1
- 2/1: revolute joint of axis $(A, \vec{y}_{1,2})$, parameter θ_2
- 4/0: prismatic joint of axis $(D, \vec{z}_{0,4})$, parameter $Z = DC \vec{z}_0$
- 3/4: prismatic joint of axis $(B, \vec{x}_{3,4})$, parameter $X = CB \vec{x}_{3,4}$
- 3/2: revolute joint of axis $(B, \vec{y}_{3,2})$, no parameter.
- 2/0: point contact in I , *it is assumed that there is no slip in I*.

Questions:

1 – Frame definition. Change of basis diagrams. Graph of links.

2 – Constraint equation(s).

- a) assuming that θ_2 and ψ_1 are nil at the initial time, prove that $\theta_2 = -2\psi_1$
- b) deduce the relationships between Z and ψ_1 , between X and ψ_1 .

3 – Motion of 3 / 0 :

- a) nature, trajectory of B .

4 – Motion of 3 / 4 :

- a) nature, trajectory of B .
- b) Determine $\vec{v}_3^0(C)$.

5 – Define the axodes of the motion 2 / 0.

a- Nature of 2/0? Deduce $\vec{v}_{2,3}^0(B)$

b- From the properties of 3/0, draw $\vec{v}_3^0(C)$

c- Using the combination of velocities for 3/4, 3/0 and 4/0, find $\vec{v}_4^0(C)$
